

LotteryCorner State Page Family Research Report

Executive recommendation

Recommendation. LotteryCorner should ship **one governed State Page family** with **capability-driven variation**, not state-by-state bespoke templates. The strongest evidence from the project governance files, the approved State blueprint, and official-state variation is that the differences that matter are mostly **data and capability differences**—commerce mode, ticket checking, subscriptions, anonymity rules, frequent-draw intensity, scratcher depth, and claim rules—not a different information architecture for every jurisdiction. The state hub should therefore stay structurally consistent while selectively activating or suppressing modules based on verified capability and source quality. [filecite\turn0file5](#)
[filecite\turn0file6](#)

Evidence. The approved cross-state decision record explicitly states: there is **one PF-02-governed State Page family**, no per-state templates, and Florida is only the first representative implementation; the approved State blueprint likewise treats the governed State Content Manifest as the contract for pages, agents, AI retrieval, monitoring, and APIs. [filecite\turn0file5](#) [filecite\turn0file6](#)

Observation. Official lottery sites consistently make users work hardest for a small set of tasks: getting the latest verified result, finding draw/cutoff information, checking a ticket, understanding how to claim, locating where to play, and understanding special add-ons or online-play eligibility. Official sites that perform these tasks well do not necessarily have the best editorial depth, while competitor sites often win on scheduling, calendars, archives, and dense all-results pages. ¹

Recommendation. The final State hub should do five jobs exceptionally well on first load: establish **state identity and freshness**, present the **first high-confidence current result block**, expose **Powerball and Mega Millions without eclipsing state-native games**, provide a safe **Check Ticket / Where to Play / Official online status** layer, and route to deeper destinations for claims, archives, scratchers, second chance, winners, news, community, and tools. Long explanatory content should move below the fold or onto dedicated pages. [filecite\turn0file5](#) ²

Recommendation. AI should be **one shared contextual answer surface**, not many scattered “Explain” buttons. The highest-value AI jobs are: explaining a result or add-on in state context, explaining pending/corrected status, explaining claim steps, clarifying purchase paths without deciding eligibility, interpreting historical-result questions, and summarizing state news with citations. Google’s current guidance is that there is **no special AI schema or machine-readable file needed** for AI search features, so the implementation should focus on source quality, visible structured content, and citation-grounded answers instead of AI-specific markup. ³

Recommendation. Ethical repeat behavior should come from **state following, result-change awareness, pending-to-verified transitions, correction history, jackpot thresholds, saved games, official winner and unclaimed-prize updates, and subscription/eligibility reminders where sourced**. It should **not** come from lucky-personalization claims, prediction framing, “near miss” celebration, loss-context purchase

prompts, or manipulative streaks. The supplied behavior research and official-source variability both support a utility-first loop rather than a gambling-intensification loop. [filecite turn0file1](#) 4

Evidence and market findings

Research method and evidence quality

Evidence. This review used four evidence classes: the uploaded governance files as product and design authority; official state lottery sites plus official Powerball and Mega Millions resources for current facts and capabilities; competitor sites as evidence of search visibility, page architecture, and usage conventions; and forum/community sources for recurring user questions. Google Search Central and Schema.org were used as the authority for structured-data and AI-search guidance. [filecite turn0file5](#) [filecite turn0file6](#) [filecite turn0file7](#) 5

Observation. Capability verification quality is uneven across jurisdictions because official lotteries publish different amounts of operational detail on the open web. Some states expose robust app, geolocation, subscription, and rewards documentation; others surface mostly results, FAQs, and retailer tools. Accordingly, this report uses the requested status vocabulary—**VERIFIED, NOT FOUND IN REVIEWED SOURCES, UNDER REVIEW**, and **NOT APPLICABLE**—and treats “not found” as a sourcing outcome, not proof of absence. 6

Evidence. Official multi-state coverage is clear at the top level: Powerball is sold in **45 states plus the District of Columbia, Puerto Rico, and the U.S. Virgin Islands**, while Mega Millions is sold in **45 states plus the District of Columbia and the U.S. Virgin Islands**. Powerball Double Play is currently listed in **30 lotteries**. 7

Inference. Comparing those official participant lists with the 50 states implies that the current **no-active-lottery states** are Alabama, Alaska, Hawaii, Nevada, and Utah; Utah’s legislature also continues to treat lotteries as constitutionally barred unless voters approved a constitutional change, reinforcing the no-lottery status. This is a strong inference from official participation lists, not a claim that each non-lottery state was separately audited through a formal operator site. 8

National jurisdiction capability findings

Evidence. The national pattern is not “different page for every state”; it is “same hub, different capability switches.” Across official sources reviewed, the biggest dividing lines are: whether the state has any lottery at all; whether it sells both Powerball and Mega Millions; whether it offers official online purchase; whether it supports subscriptions; whether it offers a ticket-checking app or scanner; whether it runs frequent-draw products such as Keno or Cash Pop; whether anonymity is broadly available; and whether claim/tax/help guidance is centralized and current. 9

Evidence. Positively verified **official online purchase** in reviewed official sources includes Connecticut, Georgia, Illinois, Michigan, Pennsylvania, and Virginia. Connecticut’s FAQ says draw games and Keno can be bought online with iLottery on web and mobile apps; Georgia’s official “Buy Now” documentation says users can buy draw games and Diggi games online anywhere in Georgia; Illinois’ FAQ says eligible players can buy games on the website, app, or at retail; Michigan’s mobile app FAQ says users can purchase draw games and online raffles in the app; Pennsylvania’s iLottery says customers can buy draw tickets and eInstants

online in Pennsylvania; and Virginia's terms and product pages confirm online game purchase within Virginia. ¹⁰

Evidence. Positively verified **subscription** support in reviewed official sources includes Maryland, Michigan, New York, and Pennsylvania. Maryland offers subscriptions for Mega Millions, Powerball, and Multi-Match through My Lottery Rewards; Michigan supports recurring online subscriptions for Powerball, Mega Millions, Lotto 47, Fantasy 5, and Millionaire for Life; New York's draw-games page promotes subscriptions for Mega Millions, Powerball, Millionaire for Life, and LOTTO; Pennsylvania offers recurring subscriptions for Powerball, Mega Millions, Match 6 Lotto, and Cash4Life. ¹¹

Evidence. Positively verified **retail-only** behavior in reviewed official sources includes Texas and Florida for normal purchase flow from the state hub context. Texas' official FAQ says tickets may not be sold by mail, phone, or internet and must be purchased from a licensed retailer in Texas; the Texas Lottery also formally prohibited courier services effective February 24, 2025. Florida, by contrast, supports app-based digital play slips and QuickTicket retail activation, but reviewed official sources still route actual ticket purchase through retailers rather than official web checkout. ¹²

Evidence. Positively verified **ticket-checking app or scanner** support in reviewed official sources includes California, Connecticut, Florida, Michigan, New York, Texas, and Virginia. California's app includes Check-A-Ticket and second-chance scan entry; Connecticut promotes CT Lottery and 2nd Chance apps; Florida's pages direct users to scan QuickTicket and save digital playslips in the app; Michigan's app and scanner FAQs make ticket scanning core functionality; New York's Ticket Check is central to NYL+; Texas' official app store listing emphasizes retailer locator and ticket checking; and Virginia's app supports ticket scanning, extra chances, and mobile ticket cashing. ¹³

Evidence. Positively verified **frequent-draw / Keno-heavy** programs include Connecticut Keno every four minutes, Georgia Keno every 3.5 minutes, Michigan Club Keno every few minutes, New York Quick Draw every four minutes, Pennsylvania Keno every four minutes, and Florida Cash Pop in five daily dayparts. These are materially different from ordinary daily draw structures and justify capability-driven variation in result grouping, schedule UI, and archive routing. ¹⁴

Evidence. Positively verified **anonymity and disclosure** rules vary sharply. California says winner identity is public record; Florida says winners are generally public, with a 90-day confidentiality window for prizes of \$250,000 or more; Maryland says draw-game, FAST PLAY, and scratch-off winners may remain anonymous, but second-chance and points-for-drawings winners are published; New York says winner name and city may be public information. This variation alone justifies state-specific claim/anonymity guides rather than a generic legal block on the hub. ¹⁵

Recommendation. The governed State hub should carry a compact, factual capability strip built from verified state data: lottery status, official operator, official purchase mode, ticket checking availability, app availability, subscriptions if any, minimum age, anonymity posture, and official claim/help path. Everything more detailed should route to a dedicated page. That preserves one family while acknowledging real state variation. ¹⁶

Deep official-state findings

Florida

Evidence. Florida is a strong example of a **retail-first draw state** with heavy daily cadence and meaningful special-format complexity. Official sources describe Pick 2/3/4/5 with Fireball, Florida Lotto with Double Play and EZmatch, Cash Pop multiple times daily, retailer-based play flows, QuickTicket lane activation for Powerball and Mega Millions, and an app that supports digital playslips and scanning. Florida also states that winners are not broadly anonymous, and its FAQ now documents that Cash4Life ended on February 21, 2026. ¹⁶

Observation. Florida's official ecosystem argues against using the State hub as an everything page. The state has too many current result states and too many special-rule variants to keep every result, claims rule, tax note, and format explainer on the hub without the page becoming bloated and hard to trust. ¹⁷

Recommendation. Florida should lead with latest verified state-native results plus national jackpots, then route aggressively to game pages and guides. Florida is the clearest case that **PLAY_TYPE cloning needs rule verification** for add-ons and effective dates before it should be trusted in production.

filecite turn0file8 ¹⁸

New York

Evidence. New York's official draw-games and live-drawings pages put heavy emphasis on schedules, close times, live broadcasts, twice-daily variants, Quick Draw, and account-based features. NYL+ supports Ticket Check, second-chance entry, points, saved favorite games, saved lucky numbers, and app-based notifications; the draw-games page also promotes subscriptions. New York's claim page makes disclosure and expiration rules explicit. ¹⁹

Observation. New York's official experience is one of the best arguments for keeping **schedule/cutoff and live-draw information compact but prominent**, and for making **archives and subscriptions** first-class dedicated destinations. ²⁰

California

Evidence. California's public-facing service pattern is unusually "service hub" oriented: CA.gov routes users to claim a prize, view results, find a retailer, and the official mobile app; the app supports ticket scanning, second-chance submissions, retailer location, and current numbers. California also explicitly says winner identity is public record. ²¹

Observation. California supports a State hub model that is lighter on legal/editorial prose and heavier on compact service routing, which is a good pattern for LotteryCorner because it scales across more jurisdictions. ²²

Michigan

Evidence. Michigan's official documentation shows one of the most mature digital ecosystems reviewed: app-based online play, ticket scanning, Daily Spin to Win, draw-game purchases, online raffles, subscriptions, geolocation, and Club Keno. Michigan also requires account and location verification for some key functions. ²³

Observation. Michigan demonstrates that a state page needs a strong **official online status explanation** component, not just a generic “Where to Play” block, when a jurisdiction has mature account-led digital play. ²⁴

Virginia

Evidence. Virginia’s official ecosystem combines online games, rewards points, digital playslips, app-based ticket scanning, extra chances, retailer location, and mobile ticket cashing. Virginia also enforces geolocation for online purchases. ²⁵

Observation. Virginia is a model for contextual commerce messaging: a single state may support retail purchase, digital play slips, online games, and mobile wallet cashing at once, so LotteryCorner should explain these modes clearly instead of reducing them to a generic “Buy Tickets” CTA. ²⁶

Pennsylvania

Evidence. Pennsylvania has a mature iLottery with online eInstants, draw-game purchases, subscriptions, geolocation, VIP Players Club, second chance, mobile app support, and Keno. Its help center also clearly separates retailer-sold support from online-play support. ²⁷

Observation. Pennsylvania is a strong template for separating **hub-level summary** from **dedicated operations pages** for subscriptions, geolocation, and second chance. ²⁸

Illinois

Evidence. Illinois’ official FAQ says eligible players can buy games on the website, in the app, or at more than 7,200 retailers, and that draw schedules and jackpots are available on the website and app. ²⁹

Georgia

Evidence. Georgia’s official “Buy Now” documentation supports online purchase of Cash 3, Cash 4, Quick Win, Cash Pop, Mega Millions, Powerball, Fantasy 5, and Keno, plus Diggi games; the official app also supports ticket scanning and purchase in Georgia, and the state has very frequent Keno drawings. ³⁰

Texas

Evidence. Texas is the clearest reviewed example of **retail-only plus courier restriction**. The official FAQ says tickets cannot be sold by mail, phone, or internet; the official policy statement prohibits courier services; retailer services and the official app support age checks, retailer locating, scratch second-chance participation, and self-check locations. ³¹

Maryland

Evidence. Maryland offers subscriptions through My Lottery Rewards and allows anonymity for draw, FAST PLAY, and scratch-off winners, while excluding second-chance and points-for-drawings promotions from the anonymity protection. ³²

Connecticut

Evidence. Connecticut's official FAQ says online purchase is available for Keno and favorite draw games through iLottery on the website and both mobile platforms; Connecticut also offers a CT Lottery app, a separate 2nd Chance app, retailer location, and frequent Keno drawings. ³³

Utah

Evidence. Utah remains the strongest no-lottery example in this review. Utah legislative material shows that the constitution historically bars authorizing a lottery absent constitutional change, and the search landscape for "Utah lottery" is therefore high-risk because unofficial or misleading pages can occupy visibility where no official lottery operator exists. ³⁴

Competitor findings

Evidence. Repeatedly visible independent competitors in sampled results included Lottery Post, Lottery USA, Lottery.net, NewYorkLotteryLive, and other schedule/result aggregators. Their strongest shared pattern is simple: one page often combines **latest results, next draw timing, schedules, past results links, calendars, and state/game navigation**, which is exactly the utility bundle official sites often fragment. ³⁵

Observation. Lottery Post is especially strong in three areas: explicit time-zone labeling, "you last visited" memory, and dense current-result grouping with immediate links to past results and calendars. Those conventions are useful and ethical because they increase continuity and user efficiency without suggesting better odds or more frequent spending. ³⁶

Observation. Lottery USA is strong at **all-results-on-one-page state overviews** and state selectors, but it also blends result utility with adjacent "Quick Picks," "play online," courier education, and even numerology/prediction products. Lottery Post similarly mixes results with predictions, systems, and specialist tools. Those patterns show why users return, but they are not safe defaults for LotteryCorner's trust model. ³⁷

Recommendation. Learn from competitors' information architecture, not their monetization psychology. LotteryCorner should copy the **clarity of result cards, next-draw times, date archives, state selectors, and neutral "more results" routing**, but should not copy prediction ecosystems, numerology hooks, or misleading quasi-official tone. The safest competitive wedge is **cleaner trust, better sourcing, and better routing**. ³⁸

Evidence. Local and national news appear most often around **winner locations, unclaimed prizes, jackpot growth, policy changes, and retailer-sale stories**, not for evergreen result verification. AP and local-news-style coverage regularly emphasize ticket-sold locations and disclosure implications, which suggests that "winner locations" and "unclaimed-prize" pages can earn search demand, but those belong in news/winner-story clusters, not as bloating blocks on the state hub. ³⁹

Forum and user-question findings

Evidence. Legitimate recurring user questions fall into a consistent set: when a result is still pending or corrected; what an add-on like Fireball, Double Play, or Megaplier means; what time the next draw is; when

cutoffs occur; where a winning ticket was sold; how to claim; whether online play is allowed; whether the winner can remain anonymous; how subscriptions work; where older results live; and how second chance works. Official FAQs across Florida, Maryland, Michigan, Pennsylvania, New York, Connecticut, and Texas repeatedly answer exactly these categories. ⁴⁰

Evidence. Florida's Pick 2 page and general games FAQ show that even apparently simple daily games need explanation-heavy support because play types, Fireball, midday/evening choices, and advance play all affect interpretation. Likewise, official multi-state and state pages repeatedly explain close times, add-ons, and claim restrictions. ⁴¹

Observation. Lottery Post forums show that communities return heavily around daily-number games, add-ons, and state identity, but much of that behavior is prediction-centric rather than utility-centric. That is useful for understanding demand concentration, not for defining the core product. ⁴²

Recommendation. The AI and community entry points should focus on **legitimate utility**: "Why is this result pending?", "What changed since my last visit?", "How does Fireball work here?", "Can I buy online in this state?", "How do I claim safely?", "What's the next draw in my time zone?", and "Where are older results by date?" Prediction or "best numbers" requests should be handled as entertainment or gently redirected, never as edge-giving advice. The internal behavior research explicitly warns about illusion of control, perceived luck, and loss-chasing risk. ⁴³

Search intent and SERP opportunities

Evidence. Sampled query families break cleanly into a few intent groups. Queries such as **[state] lottery results, winning numbers, and results today** are high-freshness verification intents. **Draw times, cutoff time, past results, and results by date** have strong utility intent and often reward schedules, calendars, and archive pages. **Claim, taxes, anonymous, online, app, subscription, second chance, scratchers, retailer, winners, and news** are better handled as dedicated destinations because they represent narrower but high-consequence or high-value tasks. ⁴⁴

Observation. Official sites are strongest where law, eligibility, or prize-handling matters; independent sites are strongest where users want a **dense utility layer**—all results, schedules, archives, and easy date access. That means the State hub opportunity is strongest for current results and state orientation, while evergreen legal/explanatory topics deserve their own canonical pages. ⁴⁵

Recommendation. The page-family SEO pattern should be:

- **State hub** for broad current-state intent.
 - **Game pages** for game-specific evergreen + current intent.
 - **Latest result pages** for immediate verification.
 - **Date-result pages** for historical verification by date.
 - **Yearly archives** for crawlable archive intent.
 - **Guides** for claim, taxes, anonymity, subscriptions, and online-play rules.
 - **Scratchers / second chance / winners / news / community** as separate clusters when sourced.
- This pattern aligns user intent with content specificity and reduces thin-content risk on the state hub. ⁴⁶

Recommended information architecture

State content cluster

Recommendation. The governed state cluster should be:

State hub → game pages → latest result pages → date-result pages → yearly archives → schedule page → claim guide → tax/anonymity guide → scratcher hub → second chance hub → news → winner stories → community → tools → datasets/downloads. This matches the approved blueprint direction that the hub should summarize and route, while deeper schedules, claims, archives, and tools belong on dedicated canonical pages. [filecite:turn0file5](#)

Observation. A state page becomes unwieldy once it tries to be: results page, game encyclopedia, legal guide, schedule database, winner newsroom, scratcher catalog, archive, and commerce explainer at the same time. The Florida proposal and Florida V0 materials make that risk visible; the Connecticut and Delaware proposal PDFs also show how quickly stacked explanatory blocks create mobile page-length pressure. [filecite:turn0file8](#) [filecite:turn0file9](#) [filecite:turn0file10](#) [filecite:turn0file11](#)

Page-family operating model

Page family	Primary intent	Unique-content requirement	Freshness	Canonical relationship	Indexability	Thin-content risk	AI role
State hub	Current state orientation and latest results	State-specific current block, capability strip, routed modules	High	Self-canonical	Index	Medium if overstuffed	Shared contextual AI entry
Game page	Learn and follow one game	Rules, schedule, odds, latest results, state-specific variants	High/medium	Self-canonical	Index	Medium	Explain additions and prize logic
Latest result	Verify newest draw	Current numbers, status, source, payout/context	Very high	Self-canonical	Index	Low	Explain result meaning

Page family	Primary intent	Unique-content requirement	Freshness	Canonical relationship	Indexability	Thin-content risk	AI role
Date-result page	Verify an exact past draw	Exact draw/ date-specific content	Medium	Self-canonical	Index	Medium at scale	Historical interpretation
Yearly archive	Browse by year/date	Aggregated archive with links	Medium	Self-canonical	Index	Medium	Query handoff
Schedule page	Draw times and cutoffs	State/game timetable with time zone	Medium/high	Self-canonical	Index	Low	Time-zone explanation
Claim guide	Safe claiming	State-specific rules, paths, docs, deadlines	Medium/high	Self-canonical	Index	Low	Claim-step explanation
Tax/ anonymity guide	Understand consequences	State-specific disclosure/ tax posture	Medium/high	Self-canonical	Index	Low	Explain scenarios
Scratcher hub	Browse instant games	Only if sustainable scratcher data exists	Medium	Self-canonical	Conditional	High if unsourced	Minimal
Second chance hub	Enter/ understand promotions	Only if current sourced promos exist	High	Self-canonical	Conditional	High if stale	Eligibility explanation
News article	Timely winner/policy news	Reported article with source-led facts	High	Self-canonical	Index	Low	Optional summarize
Community question	Genuine user Q&A	One real question + real answers	Medium	Self-canonical	Conditional	High if empty	Assistive answer drafting

Page family	Primary intent	Unique-content requirement	Freshness	Canonical relationship	Indexability	Thin-content risk	AI role
Downloadable result dataset	Machine-readable data access	Real file download or feed	High	Self-canonical	Index if valuable	High if fake shell	Natural-language dataset help

Recommendation. Do not create empty shells for the lower-right side of the cluster. If scratchers, second chance, community, or datasets are not sustainably sourced in a state, the correct state is **suppress** or **compact unavailable summary**, not templated emptiness. [filecite turns 0 file 5](#) [filecite turns 0 file 8](#)

State-hub content model

Recommendation. The module classification below should govern the State hub.

Module	Classification	Why
Latest verified results	REQUIRED ON STATE HUB	Core user task; highest freshness
Result status and corrections	REQUIRED ON STATE HUB	Trust-critical
Powerball / Mega Millions	REQUIRED ON STATE HUB	National demand, but compact
State-native games	REQUIRED ON STATE HUB	State identity and relevance
Upcoming draws	CONDITIONAL ON STATE HUB	Useful if truly current
Schedule and cutoff summary	COMPACT SUMMARY + DEDICATED PAGE	High utility, better in full table elsewhere
Ticket checking	CONDITIONAL ON STATE HUB	Only if official path verified
Where to Play	REQUIRED ON STATE HUB	Safe default commerce/access action
Official online / app / subscription	CONDITIONAL ON STATE HUB	Varies materially by state
Game discovery	COMPACT SUMMARY + DEDICATED PAGE	Prevent hub bloat
Result history and calendar	COMPACT SUMMARY + DEDICATED PAGE	Archive intent deserves dedicated URLs
Claims	COMPACT SUMMARY + DEDICATED PAGE	High-consequence topic
Taxes and anonymity	COMPACT SUMMARY + DEDICATED PAGE	High-consequence and variable

Module	Classification	Why
Payout summaries	GAME-PAGE CONTENT	Better in game/result context
Winner locations	NEWS CONTENT or WINNER-STORY CONTENT	Better as articles/pages
Unclaimed prizes	CONDITIONAL ON STATE HUB	Only when current sourced
Scratchers	CONDITIONAL ON STATE HUB	Good only where sustainable data exists
Second chance	CONDITIONAL ON STATE HUB	Only with current sourced promos
News	COMPACT SUMMARY + DEDICATED PAGE	Good as current feed
Official winner stories	COMPACT SUMMARY + DEDICATED PAGE	Separate from hub
Fund allocation	COMPACT SUMMARY + DEDICATED PAGE	Useful trust context, not above results
Quick facts	REQUIRED ON STATE HUB	Strong scan value
FAQs	COMPACT SUMMARY + DEDICATED PAGE	Keep tight on hub
Methodology and sources	REQUIRED ON STATE HUB	Trust and correction support
Responsible play	REQUIRED ON STATE HUB	Required guardrail
Community	CONDITIONAL ON STATE HUB	Only if genuine activity exists
AI	REQUIRED ON STATE HUB	One contextual answer entry
Last visit / what changed	CONDITIONAL ON STATE HUB	High utility when real
Alerts and following	MEMBER-ONLY	Best as account feature
Datasets / downloads	SUPPRESS UNTIL SOURCED	Needs real file/feed
Prediction modules	REJECT	Trust and harm risk

Evidence. This classification reflects the approved blueprint principle that current utility comes before long guidance, that state-only and multi-state games remain distinguishable, that conditional modules must record why they appear or are suppressed, and that no-lottery states must not render fake results or commercial pressure. It also reflects official-source variation across online play, claims, anonymity, app support, and frequent-draw intensity. [filecite turn0file5](#) 47

Dedicated-page content model

Recommendation. Dedicated pages should be optimized for **one main job each**.

Game pages. Must own rules, add-ons, payouts/odds, schedule/cutoffs, latest result, history linkouts, and state-specific purchase/access summary. This is where add-on explainers like Fireball, Double Play, Megaplier, or EZmatch belong. 48

Latest-result and draw-date pages. Must own exact numbers, source status, correction state, prize context, and archive navigation. They should not become generic state encyclopedias. 49

Claim and tax/anonymity guides. Must own deadlines, documents, mailing/in-person options, disclosure rules, and links to official claim centers. They should be written for safety, not promotion. 50

Scratchers and second chance pages. Must only exist where fresh official sources make them sustainable. California, Connecticut, New York, Pennsylvania, Maryland, and Florida all show forms of second-chance or promotion support, but those pages need upkeep discipline because promo windows close. 51

Community and tools. Community pages should only use QAPage when they are genuinely user-question pages with real answers; tools pages should be deterministic where possible, with AI layered on top only when ambiguity exists. 52

Structured data and experience systems

Schema and structured-data matrix

Evidence. Google’s general structured-data guidance still requires structured data to be visible, representative, current, and non-misleading; Google also does **not** guarantee rich-result eligibility even for valid markup. Google further says there is **no special schema.org structured data** required for AI features, and as of May 2026 FAQ rich results are no longer appearing in Google Search. Schema.org continues to define WebPage, CollectionPage, QAPage, FAQPage, Game, Dataset, DataFeed, DataDownload, BreadcrumbList, AdministrativeArea, Organization, and NewsArticle, but those types must still describe visible page content truthfully. 53

Observation. In the rendered text exposed during this review, reviewed official and competitor pages did not expose visible JSON-LD snippets in the parsed output, so “visible structured data on reviewed pages” remains **UNDER REVIEW** rather than verified absent. This is important because rendered text views may omit script blocks. 54

Recommendation. Use a conservative matrix:

Page family	Recommended baseline schema	Conditional additions	Do not use / cautions
State hub	CollectionPage or WebPage + BreadcrumbList + Organization	AdministrativeArea as described subject; ItemList for visible game/result lists	Do not use GovernmentService; do not use Event for routine draw schedules

Page family	Recommended baseline schema	Conditional additions	Do not use / cautions
State game page	<code>ItemPage</code> or <code>WebPage</code> + <code>BreadcrumbList</code> + visible <code>Game</code> entity	<code>FAQPage</code> only if real editorial FAQ remains valuable outside Google rich results	Do not use unsupported prize/offers markup that implies official sale
Latest result page	<code>WebPage</code> or <code>ItemPage</code> + <code>BreadcrumbList</code>	<code>ItemList</code> for the visible ticket/result elements	Do not misuse <code>Event</code> solely because a draw happened
Draw-date result page	<code>WebPage</code> + <code>BreadcrumbList</code>	same as above	Same caution as latest-result
Yearly archive	<code>CollectionPage</code> + <code>BreadcrumbList</code>	<code>ItemList</code> of visible archive entries	Avoid empty archive pages
Claim guide	<code>WebPage</code> + <code>BreadcrumbList</code>	<code>FAQPage</code> only if visible, maintained, and useful to non-Google consumers	Not <code>GovernmentService</code> for LotteryCorner
Tax/anonymity guide	<code>WebPage</code> + <code>BreadcrumbList</code>	<code>FAQPage</code> only if genuine	No legal-overclaiming in markup
Scratcher hub	<code>CollectionPage</code> + <code>BreadcrumbList</code>	<code>ItemList</code> if visible list is present	Suppress if data is thin
News article	<code>Article</code> or <code>NewsArticle</code> + <code>BreadcrumbList</code> + <code>Organization</code>	<code>VideoObject</code> if a visible video is present	Only for editorial pages
Community question	<code>QAPage</code> + <code>BreadcrumbList</code>	<code>Question</code> / <code>Answer</code> for real UGC	Only when users can genuinely answer
Downloadable result dataset	<code>Dataset</code> + <code>DataDownload</code> and optionally <code>DataCatalog</code> / <code>DataFeed</code>	<code>temporalCoverage</code> , <code>spatialCoverage</code> , <code>distribution</code>	Only if an accessible real file/feed exists

Recommendation. For GEO/AEO, do not invent special AI schema. Instead, make pages answerable: visible timestamps, source labels, correction labels, state identifiers, canonical routing, internal links to deeper explanations, and machine-readable-but-truthful markup. Google’s AI guidance explicitly rejects the “new AI file / new AI markup” instinct. ⁵⁵

Commerce and ticket-buying model

Evidence. Official purchase modes differ enough to require state-aware labeling. Reviewed official evidence supports at least these verified categories: official online purchase in CT/GA/IL/MI/PA/VA; subscription in MD/MI/NY/PA; retail-first only in FL and Texas; courier prohibition in Texas; and app-linked retail facilitation such as Florida digital playslips and QuickTicket. ⁵⁶

Recommendation. Use this state-commerce status model:

- **Official online purchase**
- **Official app purchase**
- **Subscription**
- **Authorized courier**
- **Affiliate**
- **Retail locator**
- **Positively verified retail-only**
- **Unavailable**
- **Unknown**
- **Under review**

Recommendation. Placement rules:

- At the **top of the hub**, show only a compact status line such as “Play online in Connecticut,” “Subscriptions available in Maryland,” or “Retail purchase only in Texas.”
- On **result cards**, use only safe, deterministic actions: **Check Ticket**, **View Game**, or **Where to Play**.
- In **S-07 Where to Play**, explain the verified purchase paths and retailer/app/subscription reality.
- On mobile, a sticky action should default to **Where to Play** unless the official online/app mode is positively verified for that state and safe to label.
- On game pages, use the same verified access model with state/game specificity.
- AI may explain purchase-path differences but must **not** infer eligibility or recommend affiliates. These rules are aligned with the founder decisions and behavior research that reject purchase pressure in claim, responsible-play, correction, or loss contexts. ⁵⁶filecite⁵⁶turn0file7⁵⁶
⁵⁶filecite⁵⁶turn0file1⁵⁶

Recommendation. Commerce guardrails:

- Official option first.
- Default unknown action = **Where to Play**.
- No generic **Buy Tickets** from state context alone.
- Affiliate disclosure adjacent to any compensated click.
- No commerce CTA in claim, responsible-play, correction, or likely-loss contexts.
- No “play now” pressure in no-lottery states.
Texas’ official courier prohibition and Florida/Texas retail-first behavior make these guardrails especially important. ⁵⁷

Verified purchase-path examples

Jurisdiction	Verified model	Key evidence
Connecticut	Official online purchase	iLottery on website + iOS/Android apps for draw games and Keno ⁵⁸
Georgia	Official online purchase	Buy Now supports draw games + Diggi, app purchase in Georgia ⁵⁹
Illinois	Official online purchase	Website, app, and retail are all official purchase paths ²⁹
Michigan	Official online purchase + subscription	Mobile app purchase, subscriptions, geolocation ²⁴
Pennsylvania	Official online purchase + subscription	iLottery, subscriptions, geolocation ⁶⁰
Virginia	Official online/app purchase	Online games, geolocation, app, mobile cashing ⁶¹
Maryland	Subscription	My Lottery Rewards subscriptions ⁶²
New York	Subscription	Official subscriptions promoted on draw-games page ⁶³
Florida	Retail-first + retailer/app facilitation	Retail play, QuickTicket, digital playslips/scanning ⁶⁴
Texas	Positively verified retail-only + courier prohibited	No internet/mail/phone sales; courier prohibition ⁶⁵
Utah	Unavailable	No state lottery context ⁶⁶

AI experience model

Recommendation. The best-performing AI model for this family is **one shared contextual answer surface per state page family**, with deterministic handoffs to the right page family. The approved blueprint already points in this direction, and the Florida implementation record also reflects a single AI shell rather than proliferating disconnected answer widgets. ⁶⁷ ⁶⁸

Ranked AI opportunities

Intent	Best solution	User value	Trust risk	Implementation difficulty	Recommendation
Explain this result	AI + deterministic handoff	High	Medium	Medium	Ship early

Intent	Best solution	User value	Trust risk	Implementation difficulty	Recommendation
Pending/ corrected result explanation	AI + deterministic handoff	High	Medium	Medium	Ship early
Claim-step explanation	AI explanation grounded in official rules	High	Medium	Medium	Ship early
Purchase-path explanation	AI explanation + official outbound	High	High	Medium	Ship with guardrails
Next draw in my time zone	Deterministic tool + lightweight AI	High	Low	Low	Ship early
Game/add-on explanation	AI explanation + game page handoff	High	Low/ medium	Low	Ship early
Historical-query interpretation	AI + archive handoff	Medium/ high	Low	Medium	Ship after archives
State-news summary	AI on sourced editorial feed	Medium	Medium	Medium	Ship after news pipeline
Neutral game comparison	Mostly static content, optional AI follow-up	Medium	Low	Low	Keep mostly static
Community- question assistance	AI drafting + community handoff	Medium	Medium/ high	High	Later
Prediction / lucky-number advice	Static refusal / safe redirection	Low	High	Low	Reject as core AI

Evidence. Google's AI documentation says no special AI markup is required; the better approach is source-driven, visible, structured content. Official sources also show that the highest-friction user questions are factual and procedural, not mystical. ⁶⁷

Recommendation. Avoid “Explain” buttons on every card. Use one visible “Ask about Florida Lottery” or equivalent entry on the hub, and one contextual entry on game/result pages. Offer suggestion chips only where grounding is obvious:

- Explain this result

- What changed since my last visit
- How do I claim in this state
- Can I buy online here
- What does Fireball / Double Play mean
- When is the next draw in my time zone

That is enough surface area to capture utility without UI spam. [filecite turn0file1](#)
[filecite turn0file5](#)

Engagement model

Evidence. The supplied behavior research frames the durable retention curve as: solve the task, create repeatable utility, support repeated use, then earn account creation. It also explicitly identifies recurring entry through results, tools, followed states/games, and notifications—not through pseudo-social activity or guaranteed winning narratives. Lottery Post’s ecosystem further shows that return behavior strengthens when users have utility, archives, routes, and memory of prior activity. [filecite turn0file1](#) 36

Recommendation. Ethical daily and weekly return loops should be:

Loop	Why it is ethical	Best placement
Pending → verified result transition	Completion of a factual task	Latest-result and hub
Corrections / what changed	Improves trust and continuity	Hub and result pages
Next draw + explicit cutoff	Helps timing without pressure	Hub and schedule
Followed game/state	User-owned preference	Account area + hub
Saved games / last visit	Convenience memory	Signed-in hub
Jackpot threshold alerts	User-defined threshold, not pressure	Account + jackpot pages
Official winner updates	Legitimate news interest	News/winners
Unclaimed-prize updates	Useful and time-sensitive	News and compact hub summary
Subscription or eligibility changes	Operational utility	Guide and alert landing
Community replies to a real question	Genuine conversation	Community

Recommendation. Reject these loops:

- fabricated activity;
- near-miss celebration;
- “lucky” personalization that implies better odds;
- loss-context buy prompts;

- manipulative streaks;
- countdown urgency detached from real cutoffs;
- prediction claims;
- secret “best number” framing.

The supplied behavior research explicitly flags illusion of control and loss-chasing risk, and its CTA analysis rejects purchase prompts immediately after a loss or in claim/responsible-play contexts.

filecite turn0file1

Mobile-first hierarchy

Evidence. The approved blueprint says current utility comes first, and adaptive rules can move possible-win, corrections, and live/pending draw contexts ahead of AI, ads, and purchase. That matches what official-state ecosystems and visible proposal artifacts imply: users on mobile need the current verified answer first, not a long scroll through legal detail. filecite turn0file5 filecite turn0file11

filecite turn0file9 filecite turn0file10

Recommendation. For **320 px**, **375 px**, and **390 px**, the priority stack should stay conceptually the same, with only density and truncation changing:

First viewport 1. Urgent correction or possible-win state if applicable 2. State identity, freshness, source, last-updated time 3. First verified result group 4. Compact Powerball / Mega Millions strip 5. Compact state-native continuation or “More today in [State]” 6. One safe utility action: Check Ticket or Where to Play

First scroll 7. Remaining current result groups or grouped daily variants 8. Compact next-draw / schedule / cutoff summary 9. Compact official online / app / subscription status 10. Shared AI entry 11. Compact claim / tax / anonymity summary 12. Scratchers / second chance / news / winners summaries if sourced

Later 13. Comparison table 14. Archives / tools routing 15. Sources, methodology, responsible play 16. Community and empty states only if genuine

Recommendation. Mobile design rules:

- group daily variants instead of letting nineteen separate cards dominate the hub;
- avoid horizontal scrolling for result verification;
- keep number balls readable but secondary to plain-text result structure;
- use accordions for legal depth and FAQs, not for hiding current results;
- forbid ads between a result title and its numbers;
- prevent sticky footer/ad collisions with claim or ticket-check UI.

These are design principles, not fixed pixel-height requirements. filecite turn0file7

filecite turn0file8

Design and prototype audits

Proposed-design audit

Evidence. Only three proposal PDFs were available in the uploaded artifacts for direct review in this run: **Connecticut**, **Delaware**, and **Florida**. The user-requested Arizona, Arkansas, California, Colorado,

Massachusetts, Michigan, New York, and Virginia proposal PDFs were **not available in reviewed sources**, so those remain **UNDER REVIEW** for document-specific findings. [filecite turn0file9](#) [filecite turn0file10](#) [filecite turn0file11](#)

Observation. Across the available Connecticut, Delaware, and Florida proposal PDFs, the useful recurring modules were:

- latest results near the top;
- quick facts or schedule tables;
- claim-summary blocks;
- FAQ accordions;
- responsible-play and source/methodology sections.

Those are directionally correct building blocks. [filecite turn0file9](#) [filecite turn0file10](#) [filecite turn0file11](#)

Observation. The repeated weakness in the reviewed proposals is **page-length inflation through stacked explanatory prose**. Florida in particular shows a very long progression from result blocks into draw-time/cutoff, claiming, taxes, game explainer blocks, methodology, and FAQs. Delaware and Connecticut are tighter, but they still trend toward hub-as-everything rather than hub-as-router. That is a mobile weakness even before ads are considered. [filecite turn0file9](#) [filecite turn0file10](#) [filecite turn0file11](#)

Observation. The proposal family also appears to assume a relatively broad evergreen content stack on the hub, which becomes unsafe when legal or capability facts vary sharply by state. Because anonymity, online-play eligibility, subscriptions, and game rosters change state by state, proposal copy can only be treated as style/module reference, not factual source. ⁶⁸

Recommendation. Retain these proposal ideas:

- above-the-fold current results;
 - state quick facts;
 - schedule summary;
 - FAQ-as-collapsible support;
 - source/methodology block;
 - compact claim path.
- Do not retain:
- long lower-page explainer repetition;
 - generic legal copy that is not clearly state-specific;
 - any purchase assumption that is not tied to verified state capability;
 - hard-coded ordering that privileges Powerball/Mega Millions over state-native identity everywhere.
- [filecite turn0file9](#) [filecite turn0file10](#) [filecite turn0file11](#)

Florida Prototype V0 review

Evidence. The Florida implementation record says the guarded preview currently renders 13 sections and suppresses 6, including schedule, history, scratchers, winners, and fund-allocation sections where real

support data or routes do not yet exist. It also states that the preview's Where to Play block is information-only, with no Buy Tickets / Play Online CTA and no affiliate, and that the preview carried a 10-slot ad profile with one approved placement deferred because its host section was suppressed. [filecite turn0file8](#)

Observation. That is the right instinct: when data is missing, suppress rather than simulate. The implementation record is much closer to the final architecture than a “show every module even if empty” approach would be. [filecite turn0file8](#)

Section-by-section review

Prototype area	Status	Review
First-result selection	REPLACE	Must be adaptive to freshness/urgency and state-native relevance, not a hard-coded hero logic
Grouping of 19 events	REDUCE	Too much equal-weight result surface for the hub; group daily variants and route overflow
Powerball / Mega Millions strip	KEEP AND RESTYLE	Important demand magnets, but should not eclipse Florida-native current utility
Florida-native ordering	REORDER WITHIN APPROVED RULES	Native games should be visible immediately after the first current result block
AI-entry quantity	REDUCE	One shared contextual AI surface is enough
Shared AI surface	KEEP	Best long-term model, but only when grounded
Schedule	MOVE TO DEDICATED PAGE	Hub gets compact summary only
Game comparison	KEEP AND RESTYLE	Valuable if odds and fields are strictly sourced
Where to Play	KEEP	Correct safe default; keep compact and deterministic
What changed	EXPAND	High trust/return value once corrections pipeline exists
History / tools	MOVE TO DEDICATED PAGE	Current preview correctly suppresses when route/data missing
Community / news empty states	KEEP GENUINE COLD START	Do not fabricate activity
Sources visibility	EXPAND	Must be more prominent, especially for legal and correction-sensitive blocks
Mobile H1 and first viewport	REORDER	Results and freshness should dominate; long framing copy should contract

Prototype area	Status	Review
Desktop density	REDUCE	Competing modules fragment attention
Ad density	VALIDATE / REDUCE	Protected zones matter more than theoretical slot count
Sticky ad close / legacy dismiss behavior	REPLACE	Any legacy weak-dismiss pattern should not survive
Schema and metadata	REPLACE	Should align to the conservative matrix above
Internal links	EXPAND	Final system needs strong routing to game, archive, claim, tax, and news pages
Source visibility	EXPAND	Current state needs clearer provenance
Page length	REDUCE	Final hub should summarize and route, not exhaust every topic

Evidence. The implementation record also documents that result-format handling already needs effective-date logic, including Mega Millions' 2025-04-08 format change and Florida-specific secondary/add-on structures. Official Florida pages confirm that Fireball, Double Play, EZmatch, and the retired Cash4Life workflow all require state/game-aware logic. [filecite:turn0file8](#) 18

Recommendation. On the specific PLAY_TYPE question: cloning sibling result formats is **sufficient only for simple, stable structures**. It is **not sufficient without rule verification** for:

- Mega Millions after the 2025 format change;
- Florida Lotto Double Play and EZmatch presentation;
- Pick 2 / Pick 3 / Pick 4 / Pick 5 Fireball logic and display labels;
- Cash Pop stake-sensitive interpretation;
- retired-game handling such as Florida's ended Cash4Life flow.

Those elements need official-rule validation before production. [filecite:turn0file8](#) 18

Documentation-only Florida sample page

Documentation-only Florida sample page

Recommendation. The sample below is documentation-only and intentionally avoids final H1, page-title, or meta-description copy.

User intent	Working section label	Sample short content	Source dependency	Freshness	CTA	AI role	Schema
Am I on the right page, and is this current?	Florida overview and freshness	"Florida lottery results updated from reviewed official sources. Last checked: 11:18 p.m. ET. If a draw is pending or corrected, we label it here." Editorial policy + source registry	Medium	View sources and correction policy	Explain provenance and limits	WebPage + Breadcrum

Decisions and implementation sequence

Founder decisions required

The report ends with twelve genuine founder decisions, per request.

1. **Hub density rule.** Should the hub always cap current-result cards to a fixed range such as 5–7 visible groups, with overflow routed to schedule/game pages, or can capability-heavy states exceed that range?
2. **National-jackpot placement rule.** Should the Powerball/Mega Millions strip always appear directly after the first verified state-result block, or only when jackpot/news thresholds are met?
3. **Sticky action rule.** Should any state hub use a sticky action on mobile, and if so is the default always "Where to Play" unless official online purchase is verified?
4. **Membership timing.** Should follow/save/alerts launch in phase one, or should the first public release be fully anonymous except for passive "last visit / what changed" memory?
5. **Community launch rule.** Should community pages exist only in states with real seeded activity, or should every state reserve the route but stay unindexed until genuine activity appears?
6. **Scratcher support threshold.** What minimum sustainable data standard must a state meet before a scratcher hub can launch?
7. **Second-chance threshold.** What minimum freshness and rules coverage must exist before second-chance pages can launch?

8. **Winner-story scope.** Should LotteryCorner launch winner-location and unclaimed-prize pages in phase one, or only after a reliable state-by-state sourcing workflow exists?
9. **Dataset commitment.** Will LotteryCorner publish real downloadable datasets and feeds soon enough to justify Dataset/DataDownload work in the first architecture pass?
10. **Commerce ambition.** Should the state hub remain strictly informational for phase one even in official-online states, with stronger purchase/status affordances delayed to a later phase?
11. **AI product scope.** Is the product committed to one shared state-aware answer surface, or does it want a second AI entry point on result/game pages once evidence supports it?
12. **Florida launch scope.** For Florida specifically, should launch wait for schedule/history/winner-source completeness, or ship a tighter hub that suppresses those modules until sourced?

Recommended implementation sequence

Recommendation. A low-risk sequence is:

Phase one — governance and source contracts. Finalize the state capability schema, source registry, freshness/correction rules, and state content manifest. Build the hub around verified current results, source freshness, state capability strip, compact schedule summary, claim/tax/anonymity summaries, Where to Play, and one AI entry. [filecite\turn0file5](#) [filecite\turn0file6](#)

Phase two — core destination network. Launch game pages, latest-result pages, date-result pages, yearly archives, schedule pages, claim guides, and tax/anonymity guides. This is the minimum complete crawlable cluster for SEO and user-task completion. [46](#)

Phase three — verified commerce/access. Add official-online, app, subscription, and retailer-access treatments by verified state capability. Keep unknown paths on Where to Play. [69](#)

Phase four — ethical return features. Add followed states/games, state alerts, last visit, and what changed. Launch only after the correction/change model is trustworthy. [filecite\turn0file1](#) [filecite\turn0file7](#)

Phase five — AI expansion. Turn on the shared state-aware answer surface once source retrieval, result states, and page routing are stable. Add a small set of suggested intents rather than proliferating buttons. [filecite\turn0file5](#) [70](#)

Phase six — conditional depth. Add scratchers, second chance, winner stories, news summaries, and community only in states where sourcing and operating cadence are sustainable. [71](#)

Phase seven — data products. Add downloadable datasets and any Dataset/DataFeed markup only after real files, feeds, and update processes exist. [72](#)
